

The solution covers the end-to-end real estate lifecycle from project brief to sales, with an agentic AI core

WHAT EACH MODULE DOES

- 1 End to End Agentic Orchestration**
Single platform view to manage projects from project brief to end of construction
- 2 AI Generated Unified BoQ**
AI-based unified BoQ catalog creator and data cleaner at spec level, using the client's dirty historical data
- 3 Dynamic Bottom Up CAPEX**
Item-level cost breakdown structure creator, with live commodity and macro-economic price index integration for forecasting
- 4 Smart Tender Bid Evaluation**
Automatically collects bids, flags outliers and generates an AI-recommended price range to score each bid
- 5 Portfolio Performance Management**
Agentic contract, IPC and sales data collection to track cost and revenue realization and project progress in real time
- 6 AI Value Intelligence**
Agentic workflow to predict risks and procurement value optimization opportunities by learning from historical data

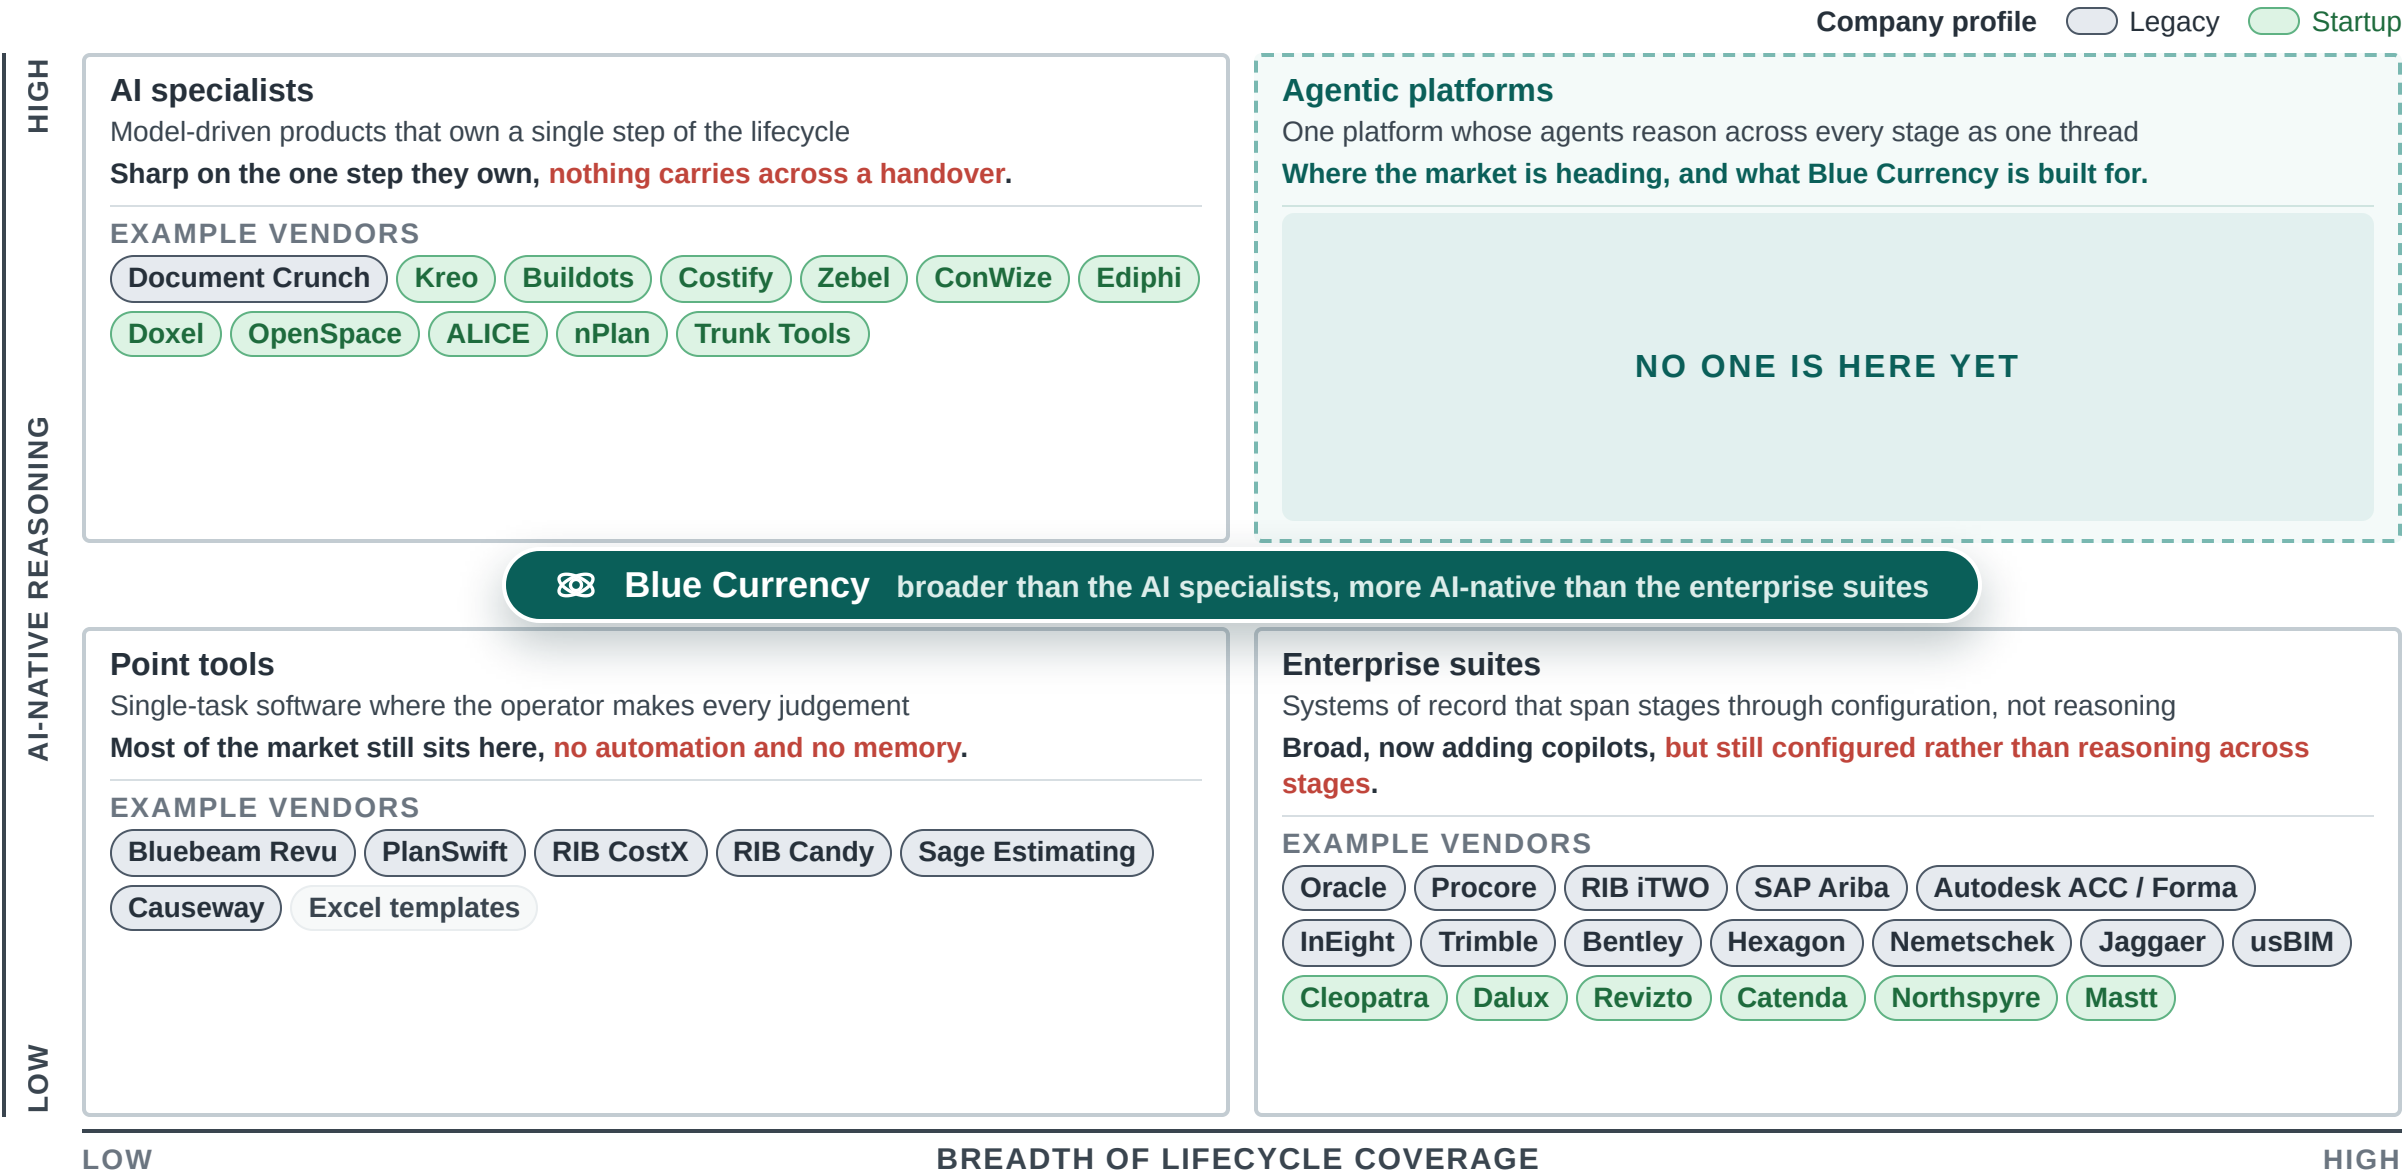

KEY VALUE PROPOSITIONS

- Covers more of the lifecycle than AI point tools, more AI-native than legacy suites
- Easy to use: covering all the fundamentals, without suite complexities
- Plug and play: fits the client's existing technology landscape with limited data prep or integration need
- Modular, and works with other McKinsey assets
- Management decision support: highlights risks, opportunities and actions

Developing players need market-leading capabilities without market-leading complexity

Module	How it is done today leaders and developing players		Severity of the problem	Our two target segments
1 End-to-End Agentic Orchestration	LEADERS	Core ERP + point solutions, with limited integration	MEDIUM	Each segment buys Blue Currency for a different reason
	DEVELOPING	E-mail, Excel and SharePoint-based workflows	HIGH	
2 AI-Generated Unified BoQ	LEADERS	Unified BoQ exists, but remains manually maintained	LOW	TARGET 1 DEVELOPING PLAYERS Cannot jump to leader maturity, and need a solution built for their needs COST Cannot justify the economics of a full enterprise stack TIME Need faster time-to-value with limited customization CAPABILITY Have fewer specialist resources to build, integrate and maintain complex systems TARGET 2 MARKET LEADERS Already sustain the enterprise stack, but two modules stay unsolved for them MODULE 1 End-to-end agentic orchestration: their ERP and point solutions still do not reason across stages MODULE 6 AI value intelligence: value engineering stays expert-led, with no continuous savings loop
	DEVELOPING	WBS standardization, but limited BoQ structure	HIGH	
3 Dynamic Bottom-Up CAPEX	LEADERS	Consultant-led or top-down estimation models	LOW	
	DEVELOPING	Last cost + inflation, with limited accuracy tracking	MEDIUM	
4 Smart Tender Bid Evaluation	LEADERS	E-tender platforms, with limited AI in comparison	LOW	
	DEVELOPING	Manual bid consolidation and Excel comparison	MEDIUM	
5 Portfolio Performance Management	LEADERS	PM and ERP systems, often not fully integrated	LOW	
	DEVELOPING	Manual tracking through Excel and e-mail	MEDIUM	
6 AI Value Intelligence	LEADERS	Expert-led value engineering, with limited AI use	HIGH	
	DEVELOPING	Value opportunities identified inconsistently	HIGH	

Our solution can target the middle ground: more AI than the ERPs and more coverage than the AI specialists

Module by module, legacy suites are feature-heavy and emerging AI tools are smart but narrow

Company profile  Legacy  Startup

Module	Legacy players	Emerging AI players
1 End to End Agentic Orchestration	BARELY Not agentic either: no automation and no learning across stages.   	BARELY Each tool owns a single stage; nobody governs the whole lifecycle.   
2 AI Generated Unified BoQ	PARTIAL Provides structure, but no BoQ catalog creation from scratch out of historical data.   	PARTIAL Document to data translation, but limited BoQ hierarchy focus.   
3 Dynamic Bottom Up CAPEX	COVERS MOST Mature estimating engines; this step is already well served.   	COVERS MOST Genuinely strong AI estimating; also well served.   
4 Smart Tender Bid Evaluation	PARTIAL Standard templates make it workable; the gap is AI recommendation and spec analysis.   	COVERS MOST They cover bid comparison well, so no real gap here.   
5 Portfolio Performance Management	PARTIAL Systems of record are entrenched, but recording is fully manual.   	PARTIAL Physical progress capture only, with no contract or IPC cost tracking.   
6 AI Value Intelligence	BARELY Static what-if analysis at gates; no continuous savings loop anywhere.   	PARTIAL Optimization exists for schedule; cost value is left untouched.
