

ARTIFICIAL INTELLIGENCE IN GOVERNMENT

AI in the service of government

Where AI creates value for the Administration today, how to protect official information, and how to build a fully secure national capability for Azerbaijan.

I Use it safely today

II Match data to the right environment

III Build the government owned capability

Seven questions, answered in order

01	Understanding AI today	What it does well, and where judgment stays human
02	Three ways to use AI	Personal, enterprise, and government owned compared
03	Matching data to the environment	Azerbaijani government data against the two governed options
04	Deep dive: enterprise account	Common use cases, example prompts, and proven impact
05	Deep dive: government owned AI	What it unlocks, with case studies from around the world
06	Building the sovereign capability	The stack and the enablers a secure environment requires
07	Where to start	A sequenced path from first use to full sovereignty

To be added

The door you choose decides which information you may use

Environment	What it is	Examples	Official work	Best used for
 Personal account A public website, private login	- Opened with a private email - What you type may train the system - The state cannot see or control its use - Text sits on a foreign company's computers	A free chatbot opened with a personal email	● No	General reading only Never official information
 Enterprise account Bought by the state under contract	- The state contracts the company - The company may not learn from your text - The state decides who may use it - Text still sits on company computers abroad	ChatGPT Enterprise, Microsoft 365 Copilot, Gemini for Government	● With limits	Public and internal work Speeches, strategies, reports
 Government owned AI Fully secure, inside the state	The government owns and runs the system - It sits in state buildings in Azerbaijan - Information never leaves the country - No outside company can reach it	An AI system on government computers, run by state staff	● Yes, fully	Sensitive and secret work Citizen appeals, closed meetings

Where to begin. An enterprise account is a good start. To unlock the full power of AI, a sovereign, government owned secure environment is needed.

Classification decides which environment fits each task

Government data sources	Enterprise account Company cloud, under contract	Government owned AI Closed, inside the state
Public Published statistics National strategies Delivered speeches Press releases Open budget data Published laws	● Safe Translate a speech into another language Compare our strategy with other countries	● Safe Draft a press statement from approved facts Summarize a long published report
Internal Operational reports Draft policy papers Program results Agency letters Meeting minutes Internal analysis	● With limits Summarize a ministry report into one page Build a progress tracker across agencies	● Safe Draft policy text from an outline Pull the action points out of long documents
Limited access Citizen appeals Personal records Draft decrees Case files Procurement papers Advice to ministers	● Not permitted This information must stay in the country	● Safe Summarize a citizen appeal and its history Send each appeal to the right ministry Draft a reply that cites the correct law
Secret Security assessments Council minutes Defense readiness Intelligence reports Cabinet papers Infrastructure plans	● Not permitted Only inside the government owned system	● Safe Combine defense and regional reports Keep one live dashboard for the President Prepare a pack for a closed meeting

Public and internal work: use cases, each with a prompt

USE CASE DOMAIN	TANGIBLE EXAMPLES		EXAMPLE PROMPT
 Draft & translate	• Speeches and public remarks • Congratulatory letters • Press statements and press lines	• Talking points for meetings • Translate cleared texts to English • Polish tone for global audiences	EXAMPLE PROMPT <i>Translate this cleared statement into formal English. Keep official titles exact.</i>
 Summarize & analyze	• Condense 50 pages to one page • Extract action points • Compare policy to OECD practice	• Benchmark against peer states • Spot trends across ministry data • Flag contradictions between reports	EXAMPLE PROMPT <i>Compare Azerbaijan 2030 to OECD practice. Return a table: our approach, theirs, the gap.</i>
 Visualize & report	• Charts from budget spreadsheets • One page visual reports • Slide packs from State Statistics	• Simple decision dashboards • Infographics for public release • Before and after comparison views	EXAMPLE PROMPT <i>Turn this budget spreadsheet into a one page visual: a chart per program, three takeaways.</i>
 Assist & coordinate	• Draft agendas and minutes • Assemble briefing packs • Track directives to closure	• Prepare questions for each item • Daily priorities and reminders • Follow up notes after meetings	EXAMPLE PROMPT <i>From these papers, draft a chair note: the decision needed and one question per item.</i>
Proven, United Kingdom M365 Copilot, 20,000 officials, 12 departments, 3 months 26 min saved daily 85% good value 82% would keep it 80% sustained use			

The same four domains, now on sensitive information

USE CASE DOMAIN	TANGIBLE EXAMPLES		EXAMPLE PROMPT
 Draft & translate	• Replies to citizen appeals • Draft decrees and decisions • Speaking notes for closed meetings	• Letters on confidential matters • Translate sensitive material • Instructions to ministries	EXAMPLE PROMPT <i>Draft a reply to this appeal that cites the correct law, in formal language.</i>
 Summarize & analyze	• Summarize an appeal and its history • Combine defense and regional reports • Review case files at scale	• Find repeated complaints • Compare ministry submissions • Judge readiness from many sources	EXAMPLE PROMPT <i>Combine these reports into one risk picture by region, with the evidence for each point.</i>
 Visualize & report	• One live dashboard for the President • Infrastructure delivery by district • Visuals for closed briefings	• Risk map by region • Budget and progress views • Alerts when a target slips	EXAMPLE PROMPT <i>Build a status view by district: budget, progress, blockers and the next milestone.</i>
 Assist & coordinate	• Send each appeal to the right ministry • Prepare packs for closed meetings • Daily secure brief for the office	• Track instructions to closure • Watch contractors and milestones • Flag decisions that are overdue	EXAMPLE PROMPT <i>List every instruction from this meeting and tell me which ones are overdue.</i>

The measured impact of these cases, proven worldwide

 Defense National force planning	10x	A live model of the whole force showed every gap. 2x faster planning, 5x faster budget decisions
 Public services ASAN style delivery	1,300h	A tool that reads the rules for inspectors. Each check cut from 40 minutes to 20
 Major ministry 30,000+ staff	1.4mn h	One tracker for every project saved hours a year and lifted citizen satisfaction by 9%
 Citizen appeals Replies to the President	75%	Drafting time cut. 95% of drafts need no edit, 100% of relevant laws identified
 President's Office Executive assistant	40%	Fewer meetings. Briefing packs and directive tracking, up to 2 hours a day saved
 Leadership analytics Dashboards for the President	Minutes	One set of numbers across ministries, answered on the spot when a decision is needed

The common thread. Every case runs on data that cannot leave Azerbaijan. This is exactly what a government owned system makes possible, and an enterprise account cannot.

A government owned capability is a full stack under national control

THE SOVEREIGN STACK, ENERGY TO POLICY

7	AI applications	Use cases for ministries and the Administration
6	Cloud & platforms	National computing and storage run by the state
5	Models & data	AI models tuned on Azerbaijani information
4	Data centers	State data centers with high performance machines
3	Connectivity	Fast national networks with backup links
2	Hardware	Trusted machines installed inside the country
1	Energy & grid	Local energy resources, a national advantage
0	Responsible AI	Rules and oversight at every layer

FOUR ENABLERS INSIDE THE ADMINISTRATION

01	A small expert team A dedicated AI team inside the Administration, learning from the supplier until it can run alone
02	The President's information Bring the Administration's documents and records into one organized place the system can use
03	Rules of use Clear rules on what staff may do, who may see what, reviewed by the Chief of Staff each quarter
04	Funding A standing budget for the platform, sized to the Administration and reviewed each year

Value now, a government owned secure environment next
